# Relevant Course Information

- ❖ Lab 0 due today @ 11:59 pm
  - *You will revisit the concepts from this program in future labs!*
- ❖ hw2 due Wednesday, hw3 due Friday
  - Autograded, unlimited tries, no late submissions
- ❖ Lab 1a released today, due next Monday (10/10)
  - Pointers in C
  - Last submission graded, can optionally work with a partner
    - One student submits, then add their partner to the submission
  - Short answer “synthesis questions” for after the lab

# Late Days

- ❖ You are given **5 late day tokens** for the whole quarter
  - Tokens can only apply to Labs
  - No benefit to having leftover tokens
- ❖ Count lateness in *days* (even if just by a second)
  - Special: weekends count as *one day*
  - No submissions accepted more than two days late
- ❖ Late penalty is 10% deduction of your score per day
  - Only late labs are eligible for penalties
  - Penalties applied at end of quarter to *maximize* your grade
- ❖ Use at own risk – don't want to fall too far behind
  - Intended to allow for unexpected circumstances

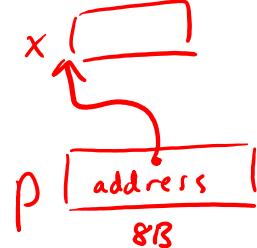

# Reading Review

- ❖ Terminology:
  - address-of operator (&), dereference operator (\*), NULL
  - box-and-arrow memory diagrams
  - pointer arithmetic, arrays
  - C string, null character, string literal
  
- ❖ Questions from the Reading?

# Review Questions

- ❖ 

```
int x = 351;
char* p = &x;
int ar[3];
```
- ❖ How much space does the variable p take up?
  - A. 1 byte
  - B. 2 bytes
  - C. 4 bytes
  - D. 8 bytes

- ❖ Which of the following expressions evaluate to an address?

  - A.  $\overset{\text{int}}{x} + 10 \rightarrow \text{int}$
  - B.  $\overset{\text{char}^*}{p} + 10 \rightarrow \text{char}^*$
  - C.  $\overset{\text{int}^*}{\&x} + 10 \rightarrow \text{int}^*$
  - D.  $\overset{\text{char}^{**}}{*(\&p)} \rightarrow \text{char}^*$
  - E.  $\overset{\text{int}}{\text{ar}[1]} \rightarrow \text{int}$
  - F.  $\overset{\text{int}}{\&\text{ar}[2]} \rightarrow \text{int}^*$

# Pointer Operators

- ❖  $\&$  = “address of” operator
- ❖  $*$  = “value at address” or “dereference” operator

- ❖ Operator confusion

$\&x$   
 $*p$

- The pointer operators are *unary* (i.e., take 1 operand)
- These operators both have *binary* forms
  - $x \& y$  is bitwise AND (we'll talk about this next lecture)
  - $x * y$  is multiplication
- $*$  is also used as part of the data type in pointer variable declarations – this is NOT an operator in this context!

*datatype* → *char\** p;  
NOT an operator

# Assignment in C

32-bit example  
(pointers are 32-bits wide)

little-endian

- ❖ A variable is represented by a location
- ❖ Declaration ≠ initialization (initially “mystery data”)

Diagram illustrating memory state for a 32-bit system. The memory is organized into 32-bit words, indexed from 0x00 to 0x24. The values shown are:

- 0x04: 03 27 D0 3C (y)
- 0x18: 00 27 D0 3C (y)
- 0x20: 24 00 00 00 (z)

Annotations indicate the operation sequence:

- RHS** (Right Hand Side) is circled in red around the value 3C at address 0x18.
- LHS** (Left Hand Side) is circled in red around the address 0x20.
- A red arrow points from the LHS annotation to the value 24 at address 0x20.

- ❖ Byte ordering (endianness) is not an issue for 1-byte values
  - The whole array does not constitute a single value
  - Individual elements are values; chars are single bytes

# Examining Data Representations

- ❖ Code to print byte representation of data
  - Treat any data type as a *byte array* by **casting** its address to `char*`
  - C has **unchecked casts** **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)  
        printf("%p\t0x%.2hhX\n", start+i, *(start+i));  
    printf("\n");  
}
```

- ❖ `printf` directives:
  - `%p` Print pointer
  - `\t` Tab
  - `%.2hhX` Print value as char (hh) in hex (X), padding to 2 digits (. 2)
  - `\n` New line

# Examining Data Representations

## ❖ Code to print byte representation of data

- Treat any data type as a *byte array* by **casting** its address to `char*`
- C has **unchecked casts** **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)

```

```
void show_int(int x) {  
    show_bytes( (char *) &x, sizeof(int));  
}  
"cast"  
(treat as)  
int*  
4 bytes
```

# show\_bytes Execution Example

```
int x = 123456; // 0x00 01 E2 40
printf("int x = %d;\n", x);
show_int(x); // show_bytes((char *) &x, sizeof(int));
```

- ❖ Result (Linux x86-64):
  - **Note:** The addresses will change on each run (try it!), but fall in same general range

```
int x = 123456;
0x7ffffb245549c 0x40
0x7ffffb245549d 0xE2
0x7ffffb245549e 0x01

# Summary

- ❖ Assignment in C results in value being put in memory location
- ❖ Pointer is a C representation of a data address
  - $\&$  = “address of” operator
  - $*$  = “value at address” or “dereference” operator
- ❖ Pointer arithmetic scales by size of target type
  - Convenient when accessing array-like structures in memory
  - Be careful when using – particularly when *casting* variables
- ❖ Arrays are adjacent locations in memory storing the same type of data object
  - Strings are null-terminated arrays of characters (ASCII)
